To: U.S. Nuclear Regulatory Commission
ATTN: Document Control Desk
Washington, DC 20555-0001

Subject: Request for Regulatory Rediscussion Regarding 10 CFR 50.54(k) Staffing
Requirements for Vogataya Generating Station

InterATOM Power hereby requests a formal meeting or technical discussion with NRC staff to discuss the application and interpretation of 10 CFR 50.54(k) as it pertains to the operational profile of Vogataya Generating Station.

The purpose of this request is to initiate a dialogue regarding the “present at the controls” requirements stipulated in 10 CFR 50.54(k). As our station moves toward operations, we believe a rediscovery of the current regulatory implementation is necessary to ensure alignment with modern safety enhanced technologies while maintaining the highest standards of public health and safety.

We propose the following topics for the agenda:

- Clarification of “Present at the Controls”: Discussing the physical and functional boundaries of the control area in light of control room improvements and operator human performance tools.
- Operational Flexibility: Exploring how current staffing requirements interface with Vogataya Generating Station’s specific technical specifications and safety analysis reports.
- Safety Justification: Presenting preliminary data or analyses that demonstrate how Vogataya Generating Station maintains core and containment integrity under proposed alternative staffing frameworks.

We suggest a meeting to be held under the month of May. This will allow Vogataya Generating Station to present technical details and receive preliminary feedback from the NRC’s Office of Nuclear Reactor Regulation

Please contact Lemion to coordinate the specifics of this meeting. We look forward to a productive exchange that supports both regulatory clarity and operational excellence.

Sincerely,
Lemion
Operations Director at InterATOM Power
Vogataya Generating Station
